fins

fins are mould elements with U-shaped cross-section in 70 x 70 mm format. They are popularly used as lean concrete slats for facades, for the purpose of providing large window areas with permanent visual and sun protection or providing the building casing with creative design elements. The geometric shape of the fins allows special light effects in interiors when there is daylight outside.

70 x 70 x 1800 mm
70 x 70 x 3600 mm
Panel thickness: 13 mm

More square, right angle or circular cross sections available on request.

Fastening

fins can either be mounted exposed with rivets or concealed with Rieder fastening brackets.

Rieder fastening brackets are part of an intelligent mounting system with aluminium inserts that allows an easy and cost-efficient installation. Through the pre-assembly of the bracket off-site and the uniform handling an efficient assembly on site regardless of weather conditions is guaranteed. The fastening brackets are exclusively available at Rieder.

Rieder fastening bracket

- | easy installation
- | offsite pre-assembly of brackets
- | fast installation onsite
- | simple mounting and fine adjustment
- | economical solution
